

As a licensed Amateur Radio Operator, I urge the FCC not to approve ANY form of broadband over power lines until the broadband industry is able to resolve the radio interference issues which have been observed in every test of BPL to date.

It is unclear why the FCC has shown a total disregard for the current users of the public High Frequency spectrum, but it is becoming more obvious that vast political and economic forces are being mobilized in an effort to force BPL down the public's throat regardless of the consequences. There are many alternative technologies available to provide high speed internet access to the public; there is simply no need to destroy the 3-30 MHz spectrum just for the sake of short-term corporate profits.

Please stop BPL now before it is too late.
